Menopause and Cardiometabolic Disease Risk

Charlotte Onland-Moret

Content

- What are cardiometabolic diseases?
- What is menopause?
- Association between menopause and cardiometabolic disease
- Some basic genetics
- Assignment

What are cardiometabolic diseases?

- Combination of different diseases
  - Cardiovascular disease (CVD)
    - Coronary Heart Disease (CHD)
    - Stroke
  - Type 2 diabetes

- Common risk factors
  - Obesity
  - High tiglyceride levels
  - Low HDL cholesterol (good cholesterol)
  - Elevated blood pressure

Cardiovascular diseases

- Class of diseases that involve the heart or blood vessels
- Coronary artery disease (CAD) or coronary heart disease (CHD)
- Stroke
- Heart failure, etc.

- Leading cause of death in the world
- Estimated that 90% is preventable.

- Underlying mechanisms unclear
- For large group: atherosclerosis

Cardiovascular disease death rates (per 100,000), 2016

Age-standardized death rates from cardiovascular disease, measured as the number of deaths per 100,000 individuals across both sexes. Age-standardization assumes a constant population age & structure to allow comparisons between countries and with time without the effects of a changing age distribution within a pop (e.g. aging).

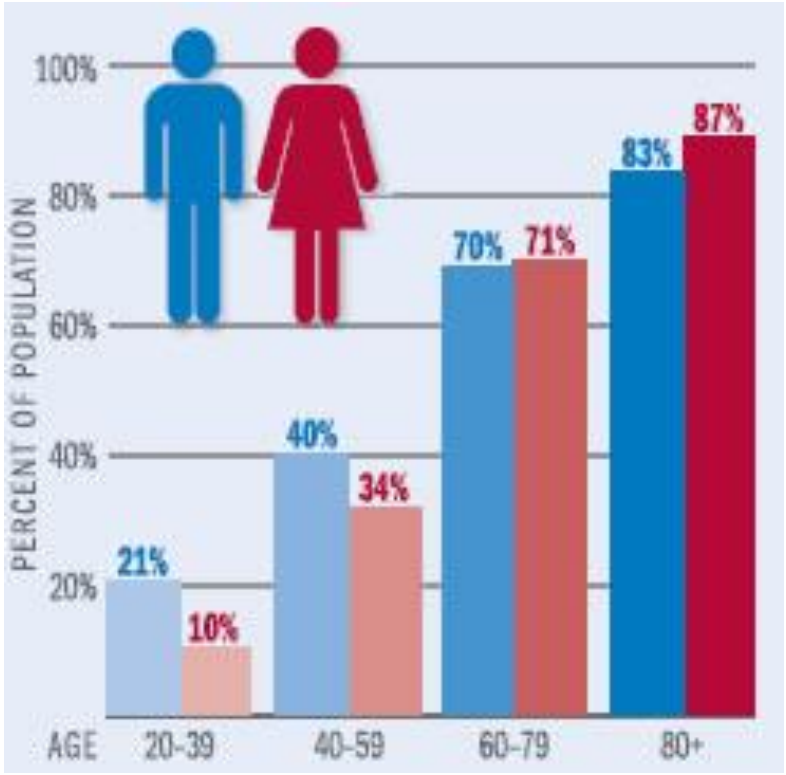
Ratio of male to female death rates in USA of CVD in women by age



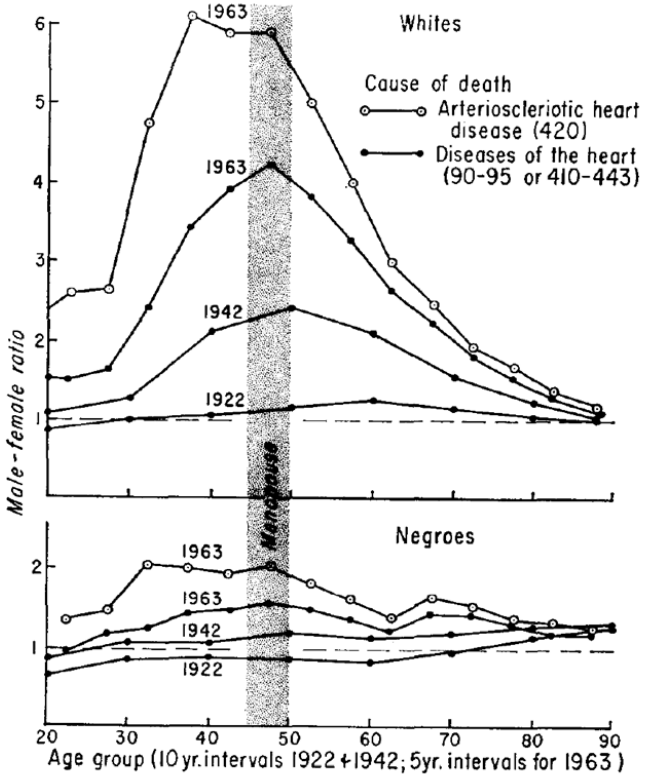


FIG. 1. Ratio of male to female death rates, United States. The dashed line marking a ratio of *one* represents the female death rates, which constitute the baseline to which the males are compared [1, 2].

Tracey RE, J Chron Dis 1966

Early studies quantifying risks

TABLE 2.—*Prevalence of Atherosclerotic Disease in Castrate and Noncastrate (Control) Women*

Group	No.	AP	MI	PVD	Total Definite Atherosclerotic Dis.	QAP	Total
Castrate	102	15	1	3	19	3	22
Control	112	4	1	0	5	3	8
Statistical significance		$0.01<P<0.025$			$P<0.005$		$0.005<P<0.01$

AP indicates angina pectoris; *MI*, myocardial infarction; *PVD*, peripheral vascular disease; *QAP*, questionable angina pectoris.

Robinson et al. 83/909

	D+	D−	
Ca	16	86	102
Co	5	107	112

$OR = \frac{16 \cdot 107}{86 \cdot 5} = 4$

Table 4. Incidence of Coronary Heart Disease by Age, Menopausal Status, and Type of Menopause. Framingham Study: 20-Year Follow-up*

Age at Examination, Menopausal Status	Person-Years at Risk	New CHD† N	New CHD† Rate per 1000 per Year	P‡
Less than 40 *yrs*				
Premenopausal	4718	0	0.0	
Natural menopause	36	0	0.0	
Surgical menopause	406	0	0.0	
40 to 44 *yrs*				
Premenopausal	4922	1	0.2	
Natural menopause	288	0	0.0	1.000
Surgical menopause	1088	5	4.6	0.001
45 to 49 *yrs*				
Premenopausal	4492	5	1.1	
Natural menopause	1726	6	3.5	0.083
Surgical menopause	2026	5	2.5	0.302
50 to 54 *yrs*				
Premenopausal	1382	5	3.6	
Natural menopause	4844	21	4.3	1.000
Surgical menopause	2618	11	4.2	1.000

* Total rates not computed because the age-specific ratios differ more than would be expected by chance. Persons with menopause other than surgical or natural are omitted from this table.

† Coronary heart disease (CHD), is the occurrence of angina pectoris, myocardial infarction, coronary insufficiency, or coronary heart disease death in women free of cardiovascular or rheumatic heart disease.

‡ Probability that the rates for premenopausal and postmenopausal women of the specified type are the same.

Age + HDL-C level	1 [Reference]	1.46 (0.79-2.69)	1.43 (0.76-2.67)	2.06 (1.10-3.85)
Age + LDL-C level	1 [Reference]	1.48 (0.80-2.74)	1.53 (0.83-2.82)	2.06 (1.13-3.77)
Age + TC level	1 [Reference]	1.49 (0.81-2.75)	1.52 (0.82-2.80)	2.24 (1.23-4.08)
Age + diabetes mellitus	1 [Reference]	1.34 (0.72-2.47)	1.40 (0.76-2.59)	1.91 (1.05-3.50)
Age + CRP level	1 [Reference]	1.34 (0.73-2.48)	1.37 (0.75-2.53)	1.94 (1.05-3.59)

Abbreviations: BMI, body mass index; CI, confidence interval; CRP, C-reactive protein; FEI, free estradiol index; HDL-C, high-density lipoprotein level; LDL-C, low-density lipoprotein cholesterol; OR, odds ratio; TC, total cholesterol; TG, triglyceride.

[a]The FEI was calculated by dividing total estradiol level (in picomoles per liter) by SHBG level (in nanomoles per liter) (to convert estradiol to picomoles per liter, multiply by 3.671; SHBG to nanomoles per liter, multiply by 8.896).

Lee JS, Arch Neurol 2010

AMH level and decline rate and Cardiovascular Risk

Table 3. Hazard Ratios for the Association of Fully Adjusted AMH Levels and AMH Decline Trajectories With the Risk of Total CVD, CHD, and Stroke

Variable	↓AMH Level HR (95% CI)	*P* Value	AMH Decline Rate HR (95% CI)	*P* Value
Total cardiovascular disease				
Only time-varying AMH level	1.21 (1.07–1.37)	<0.01		
Only time-varying decline rate			1.46 (1.14–1.87)	<0.01
Time-varying AMH level and decline rate	1.12 (0.98–1.28)	0.09	1.42 (1.09–1.86)	0.01
Coronary heart disease				
Only time-varying AMH level	1.26 (1.08–1.46)	<0.01		
Only time-varying decline rate			1.56 (1.15–2.12)	<0.01
Time-varying AMH level and decline rate	1.16 (0.98–1.37)	0.09	1.49 (1.07–2.07)	0.02
Stroke				
Only time-varying AMH level	1.03 (0.82–1.30)	0.78		
Only time-varying decline rate			1.17 (0.94–1.45)	0.16
Time-varying AMH level and decline rate	1.00 (0.78–1.25)	0.93	1.14 (0.94–1.37)	0.17

Models are adjusted for age, OC use, smoking, BMI, menopausal status, TC, DBP, $_{log}$HDL-C, HT, glucose, lipid-lowering medication, and blood pressure-lowering medication.

AMH indicates anti-Müllerian hormone; BMI, body mass index; CHD, coronary heart disease; CI, confidence interval; CVD, cardiovascular disease; DBP, diastolic blood pressure; HDL-C, high-density lipoprotein cholesterol; HT, hormone replacement therapy; OC, oral contraceptive; and TC, total cholesterol.

De Kat AC, Circulation 2017

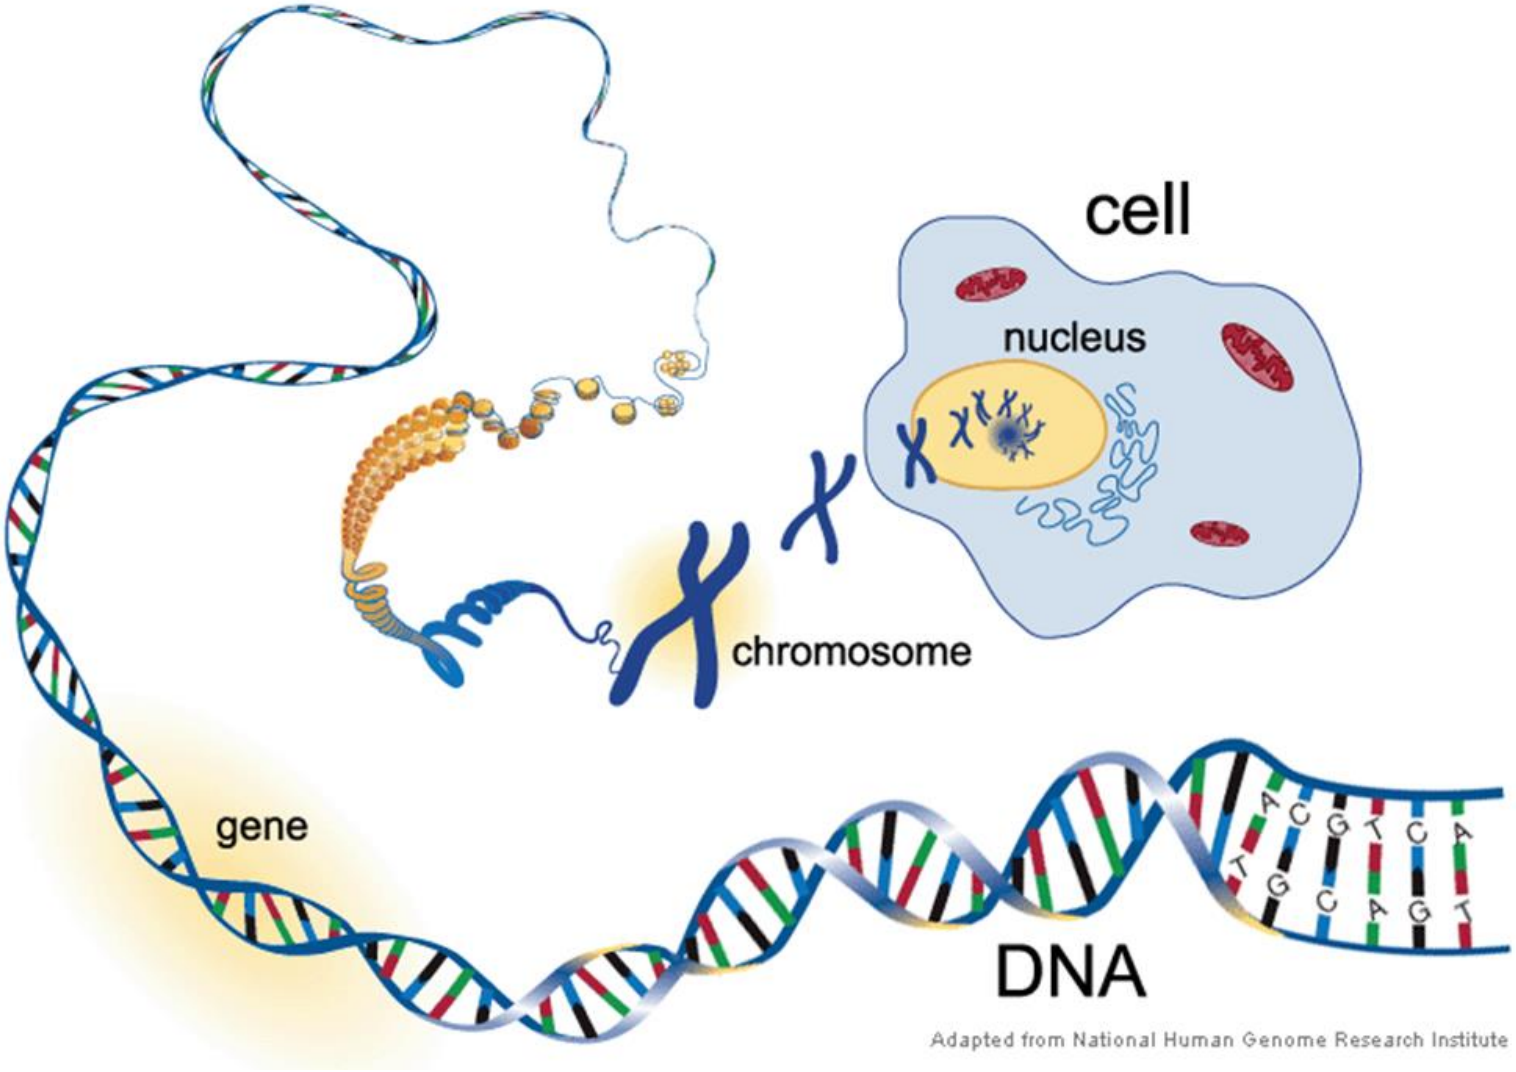
Concluding

- Menopause is associated with higher cardiometabolic disease risk
- Causality is unclear
- Mechanism is unclear
  - Estrogens -> not very likely
  - Traditional risk factors: only total and LDL cholesterol are higher in postmenopausal women
- AMH may consitute a new possible mechanism

Any questions so far?

UMC Utrecht

Intermezzo: some basic genetics



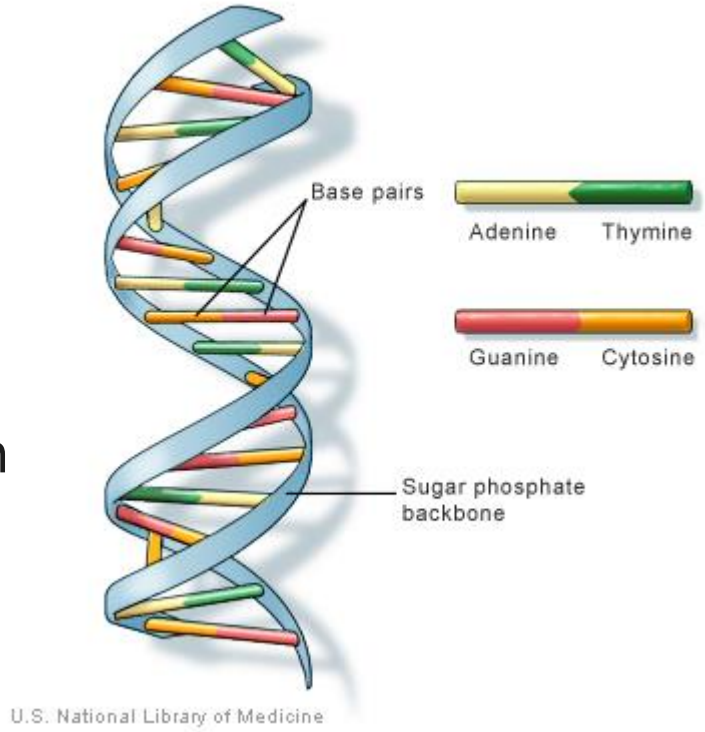
Watson and Crick

1953: Watson and Crick described double helix structure of the DNA

DNA

- All living things have DNA

- Sugar phosphate backbone
- 4 bases
  - Adenine, Thymine
  - Guanine, Cytosine
- 2 strands joined together through complementary basepairs
  - A-T
  - C-G

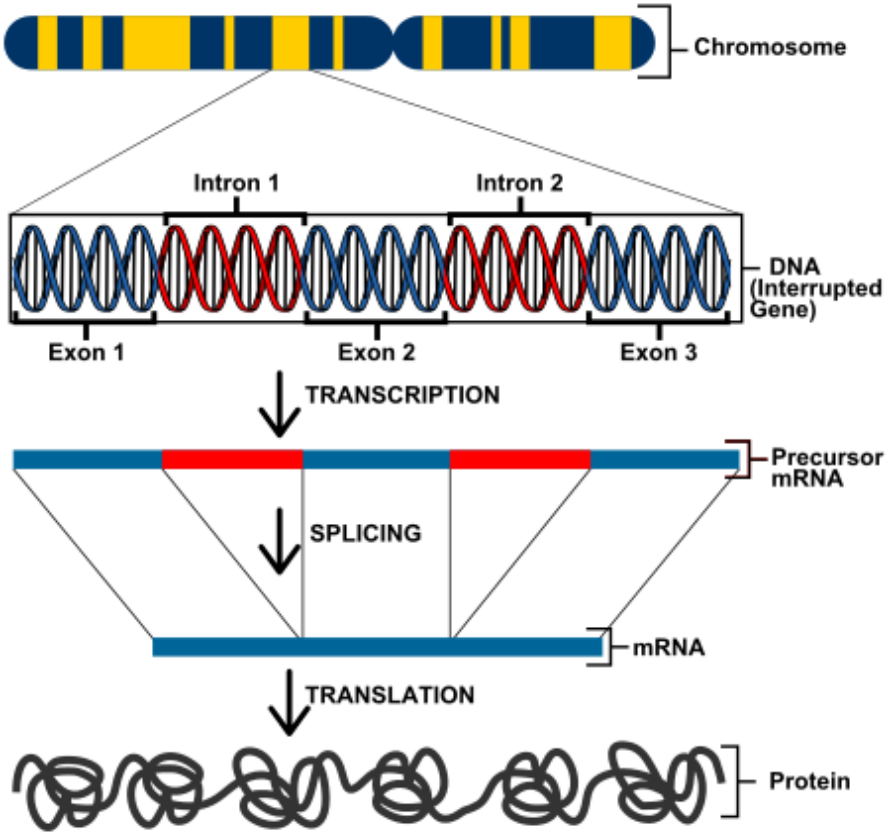


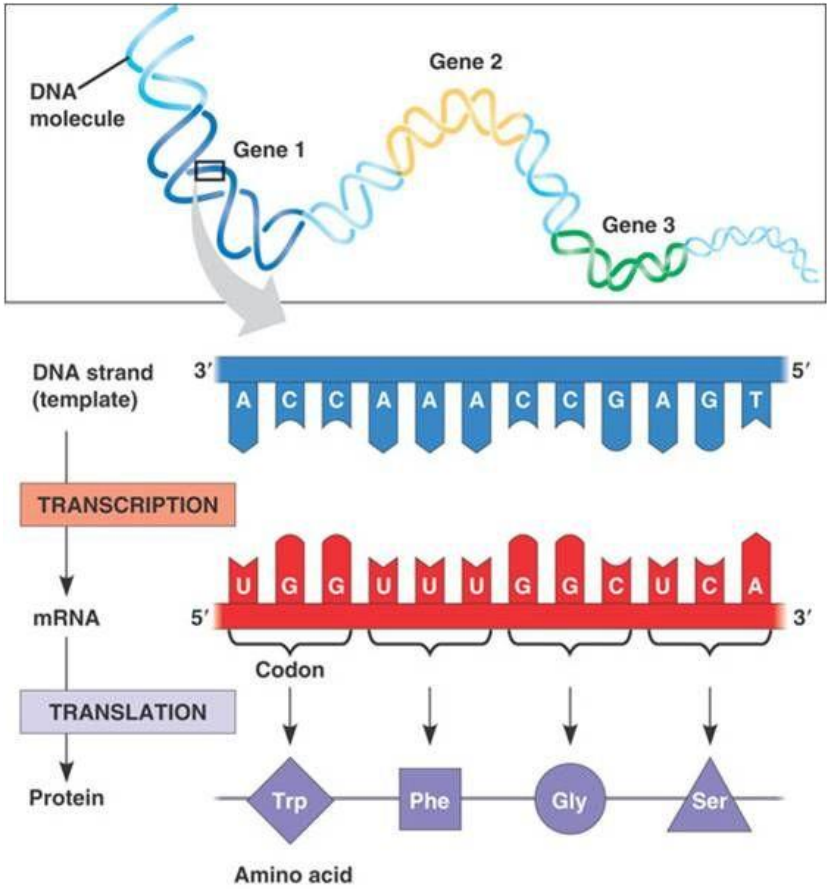
Sequence

- Order of bases make up a sequence
- Human genome:
  - 3 billion letters
  - Fill 1,000 200 page books
- >99.9% of our DNA is the same
  - 1.4M differences

  -> makes us unique

Transcription and Translation





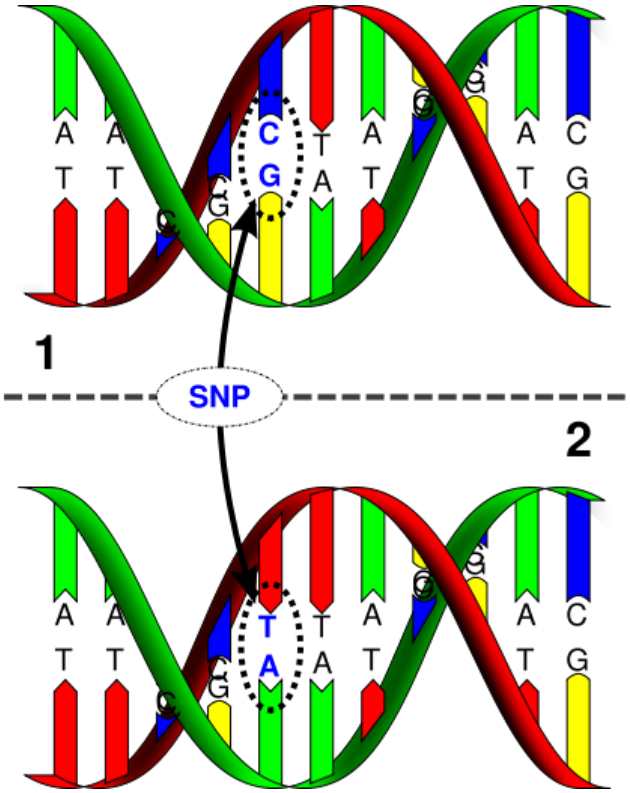
Mutations

- During DNA replication -> mutations occur
- Not all mutations lead to diseases
- Most mutations are harmless

- DNA repair

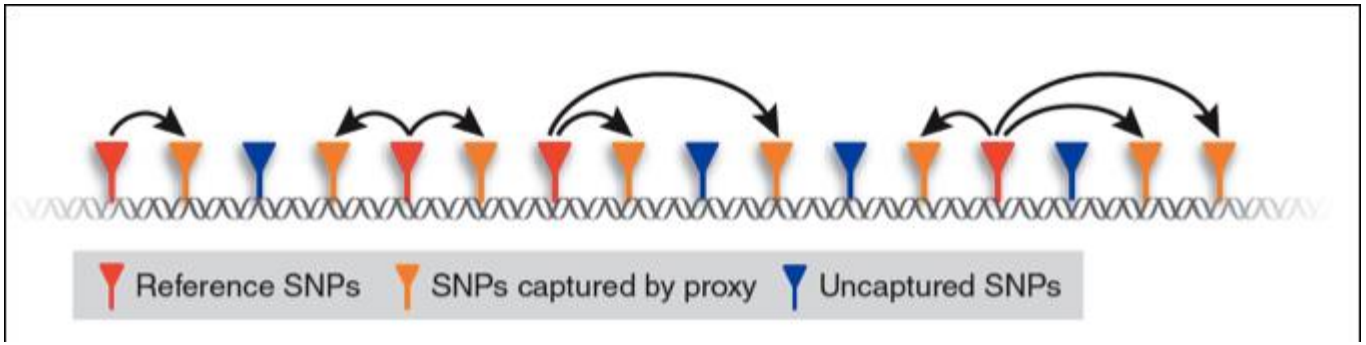
Single Nucleotide Polymorphism (SNP)

- Point mutation
- Common vs rare
- Hapmap Project:
  - To buillt genome-wide inventory of 3M human SNPs
- 1000 Genome project
  - Sequencing to identify nearly all variants



Linkage disequilibrium (LD)

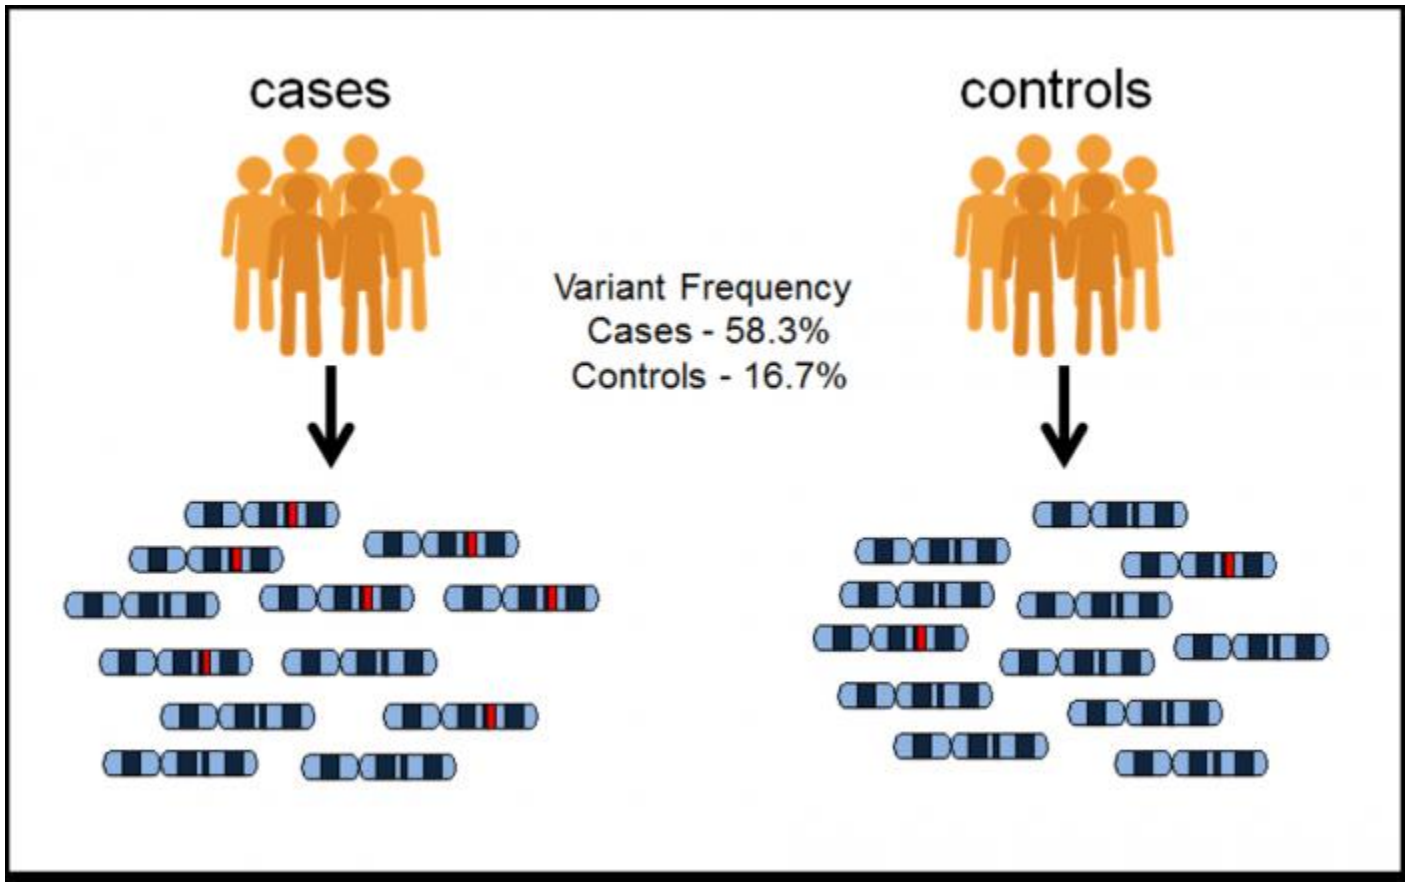
- Nearby variants on the chromosome are correlated



Why genetics?

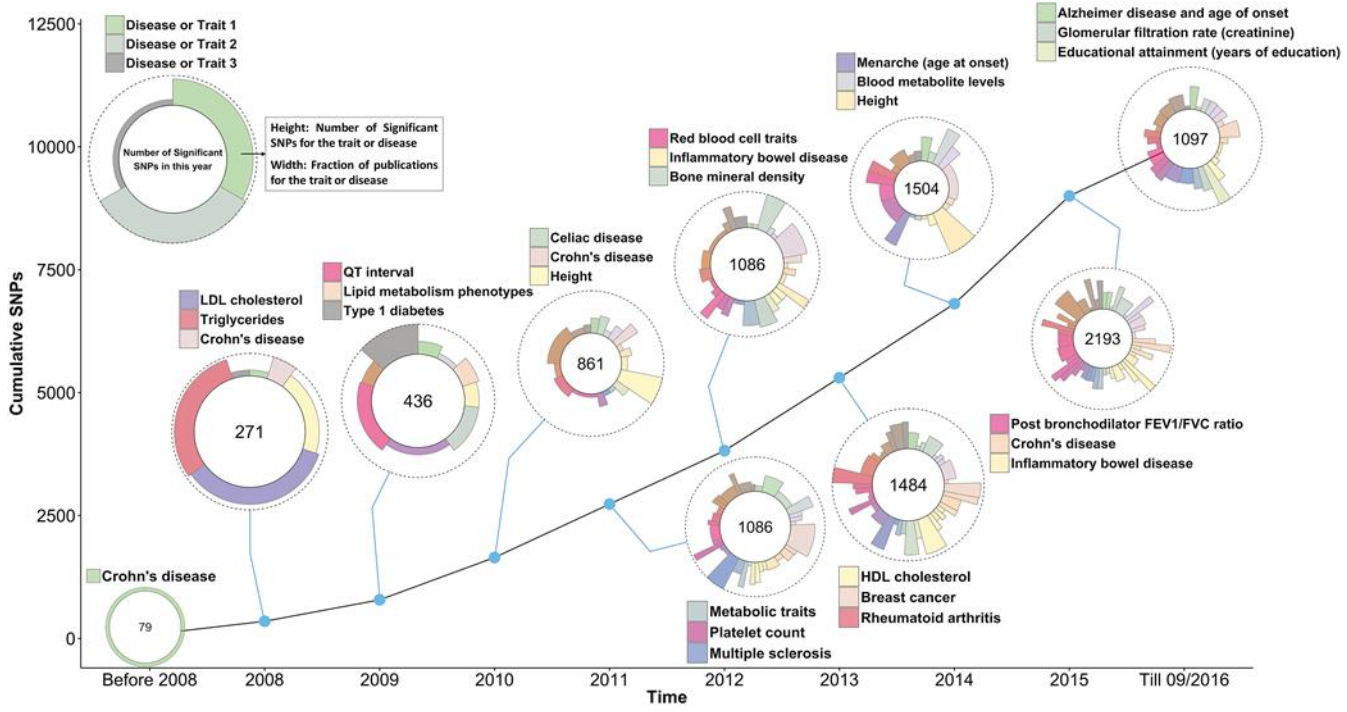
- Understanding the genetics of a disease may help understand mechanisms causing that disease
- May lead to new therapies

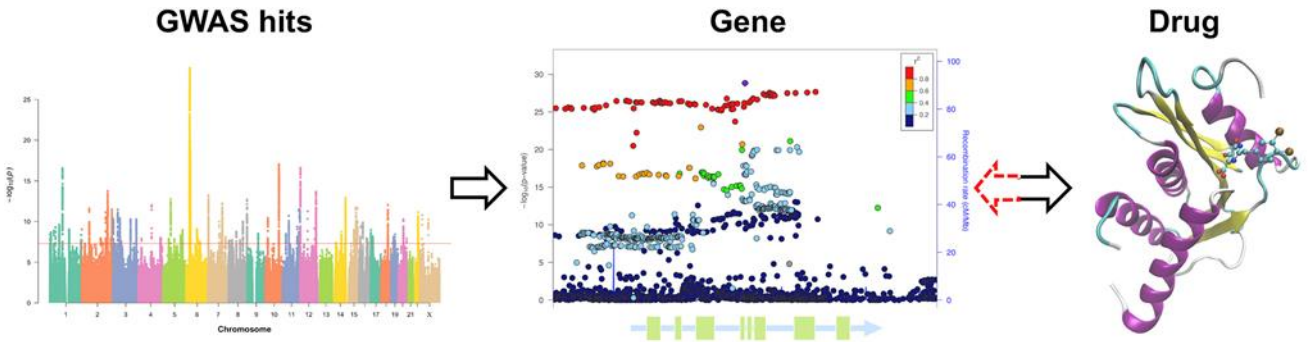
Genome-Wide association studies



GWAS

- To identify genetic variants associated with disease

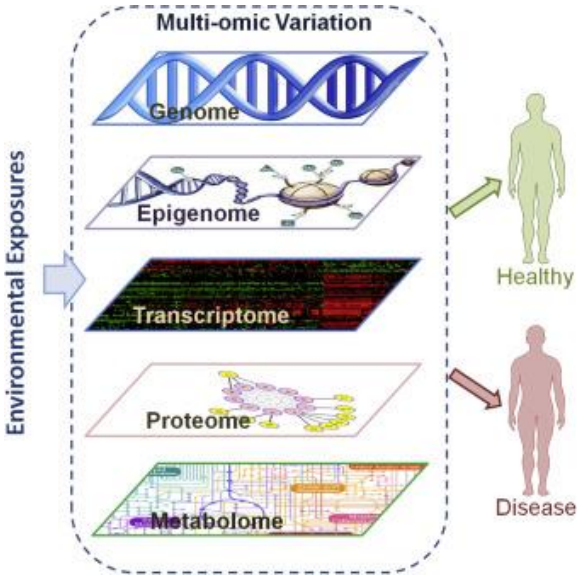


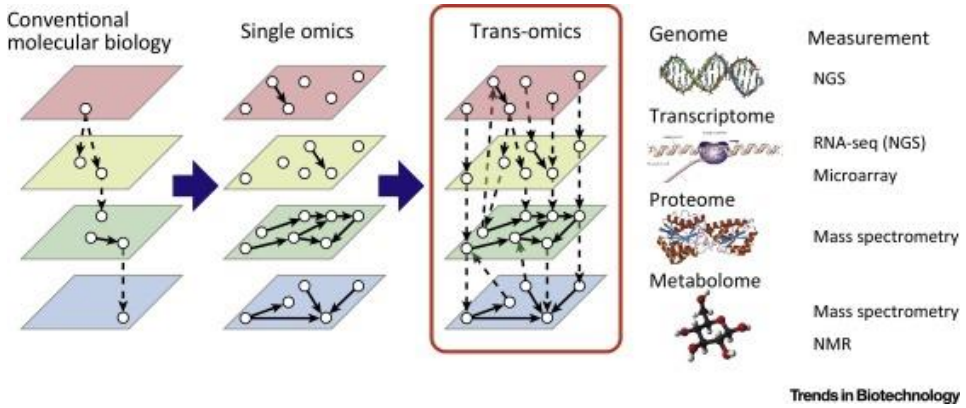


Trait	Gene with GWAS hits	Known or candidate drug
Type 2 Diabetes	*SLC30A8/KCNJ11*	ZnT-8 antagonists/Glyburide
Rheumatoid Arthritis	*PADI4/IL6R*	BB-Cl-amidine/Tocilizumab
Ankylosing Spondylitis(AS)	*TNFR1/PTGER4/TYK2*	TNF-inhibitors/NSAIDs/fostamatinib
Psoriasis(Ps)	*IL23A*	Risankizumab
Osteoporosis	*RANKL/ESR1*	Denosumab/Raloxifene and HRT
Schizophrenia	*DRD2*	Anti-psychotics
LDL cholesterol	*HMGCR*	Pravastatin
AS, Ps, Psoriatic Arthritis	*IL12B*	Ustekinumab

Other sources of information

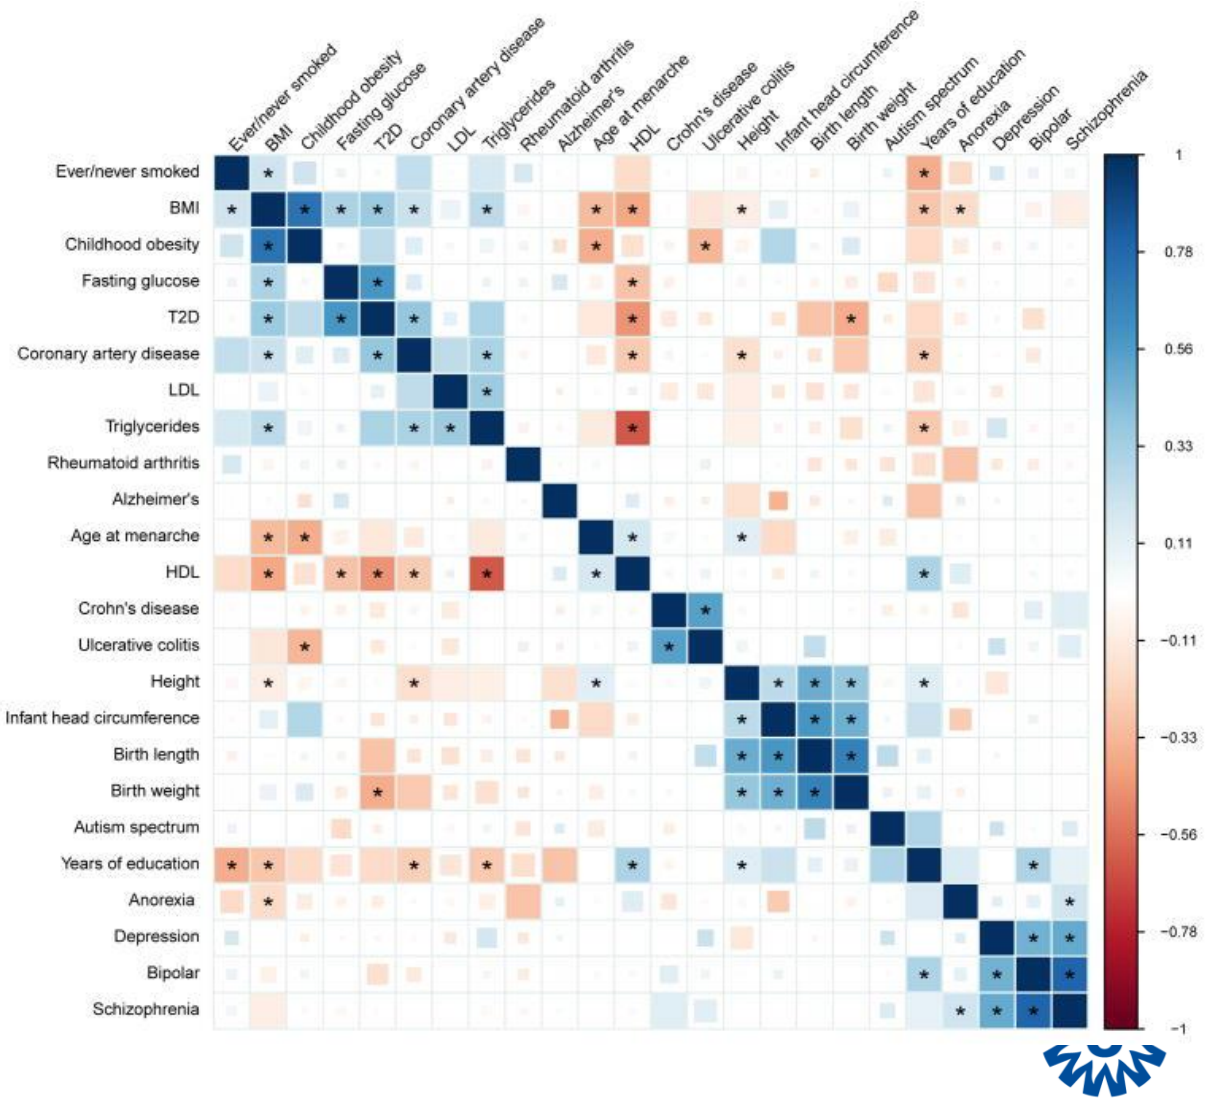
- SNPs are only one layer of variation in the genome





How can we use this information to understand mechanisms

- Genetic correlation between traits



Concept of Mendelian Randomization

Here you can perform your online MR study with summarized data

Burgess S, Br Med J 2012

Age at menopause

ARTICLES

nature genetics

Large-scale genomic analyses link reproductive aging to hypothalamic signaling, breast cancer susceptibility and BRCA1-mediated DNA repair

54 common SNPs and 2 rare variants associated

FR Day et al. *Nature Genetics* **volume 47**, 1294–1303 (2015)

GWAS

- GWAS menopause
  - Day FR et al. Nat Genet 2015; 47(11):1294-1303
  - 54 SNPs
- GWAS CHD
  - Nikpay M et al. Nat Genet 2015; 47(10):1121-1130
  - 46 SNPs
- GWAS T2D
  - Scott RA Diabetes 2017; DOI: 10.2337/db16-1253
  - 128 SNPs

Questions

UMC Utrecht

Assignment

- Combine different datasets to identify new mechanisms behind the association between menopause and cardiometabolic diseases

What to do?

- We do not have all data in one dataset
- A lot of data is publically available online
- Sources:
  - Genetic data: Reprogen, Diagram consortium, cardiogramplusc4d, dbgap (https://www.ncbi.nlm.nih.gov/gap)
  - Link between different sources of data: BIOS
    - https://www.bbmri.nl/omics/
  - DNA methylation (epigenetics, diabetes and obesity are there): http://202.97.205.78/diseasemeth/
