

Overview of ME research

Session 6a
25 February 2019

Prof.dr. Sjaak Brinkkemper
Dr. Sietse Overbeek

Universiteit Utrecht

Agenda

- We are standing on the shoulders of giants...
 - Method engineering
 - Creation of methods
 - Tool support
 - Method comparison
- ...but do not always agree with each other

“If I have seen further it is only by standing on the shoulders of giants.” (Newton, 1667)

World-wide researcher network

Defining: Method engineering

Term coined by [Kumar & Welke](#) (GSU, Atlanta, 1992):

“There is no detailed information systems methodology which is best in all situations.” → solution: method engineering

Definition by [Brinkkemper](#) (Twente, 1996):

“Method engineering is the engineering discipline to design, construct and adapt methods, techniques and tools for the development of information systems.”

Situational method engineering

“How to **adapt** your method to a particular **project situation**?”

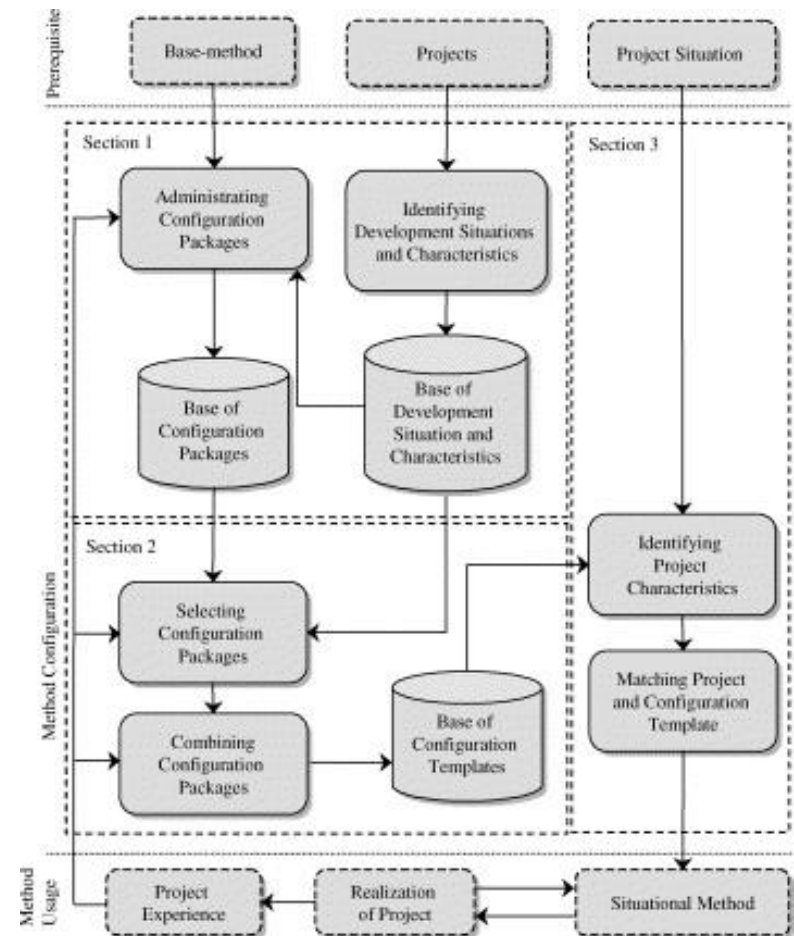

- Harmsen, Brinkkemper & Oei (1994): A situational method is “an information systems development method tuned to the situation of the project at hand”
- Ralyté, Deneckère, Rolland (Sorbonne, 2003): adapt methods to the project situation at hand

Method configuration

- To adapt a particular method to various situated factors.
- Focus is on one method which is configured in a particular situation, instead of using a set of methods as a base for assembly.

*Karlsson (Uppsala, 2002);
Karlsson and Ågerfalk (2004)*

Incremental method engineering

- “How do methods **evolve over time**, and how should this be supported?”
- Rossi, Ramesh, Lyytinen & Tolvanen (Jyvaskyla, 2004): “How to preserve method rationale?”
- van de Weerd, Brinkkemper & Versendaal (2010): “Which increments occur most frequently? What are the main drivers for method increments?”

Outline

- We are standing on the shoulders of giants...
 - Method engineering
 - Creation of methods
 - Tool support
 - Method comparison
- ...but do not always agree with each other

Why method construction?

- To develop a new method to satisfy a set of situational requirements
- To add alternative ways-of-working in a method
- To extend a method by a new functionality

(Ralyté & Rolland, 2003)

Harmsen, Brinkkemper & Oei (1994)

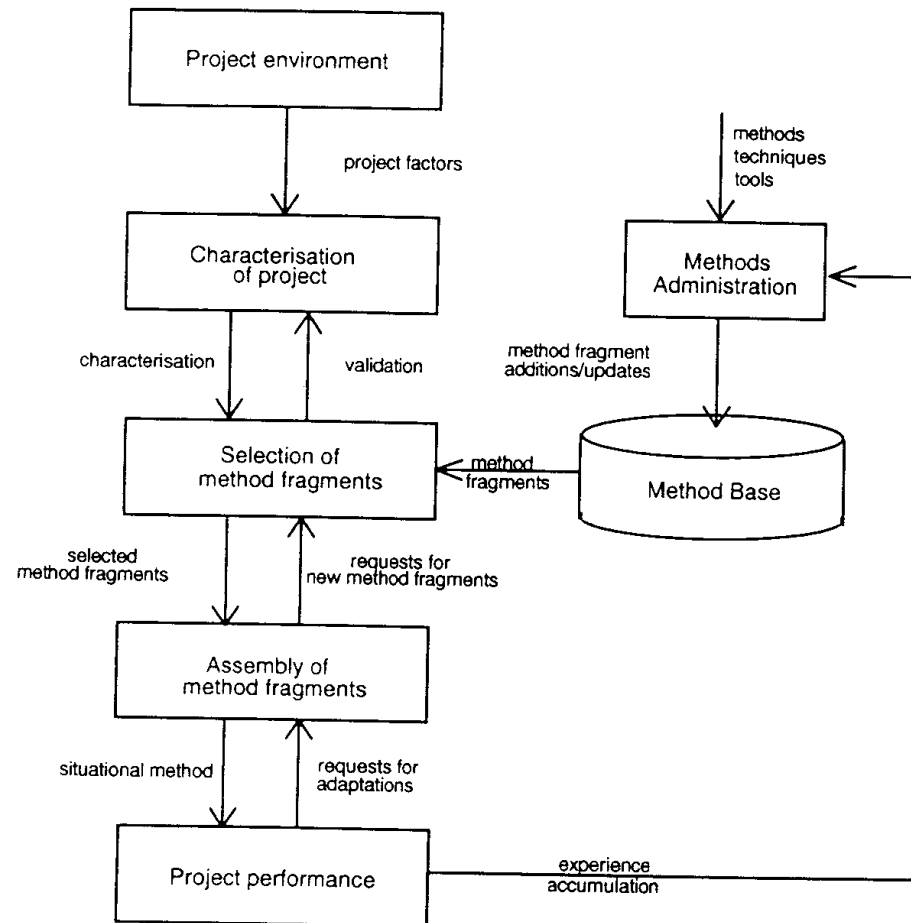

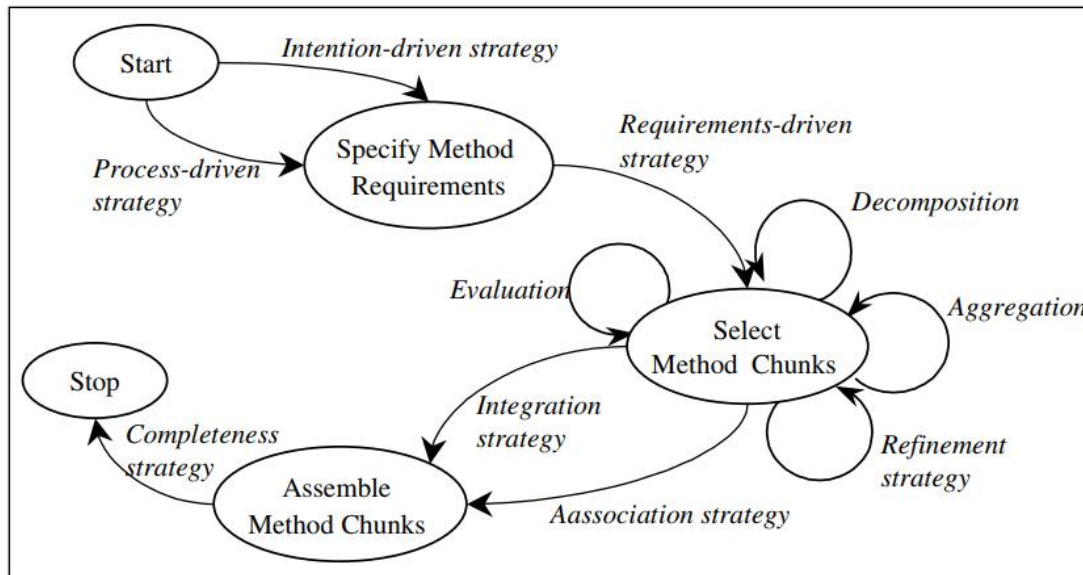

Figure 1 The process of configuration of situational methods

An assembly-based process model for situational method engineering

1. Specify method requirements
2. Select method fragments
3. Assemble method fragments

(Ralyté, Deneckère & Rolland, 2003)

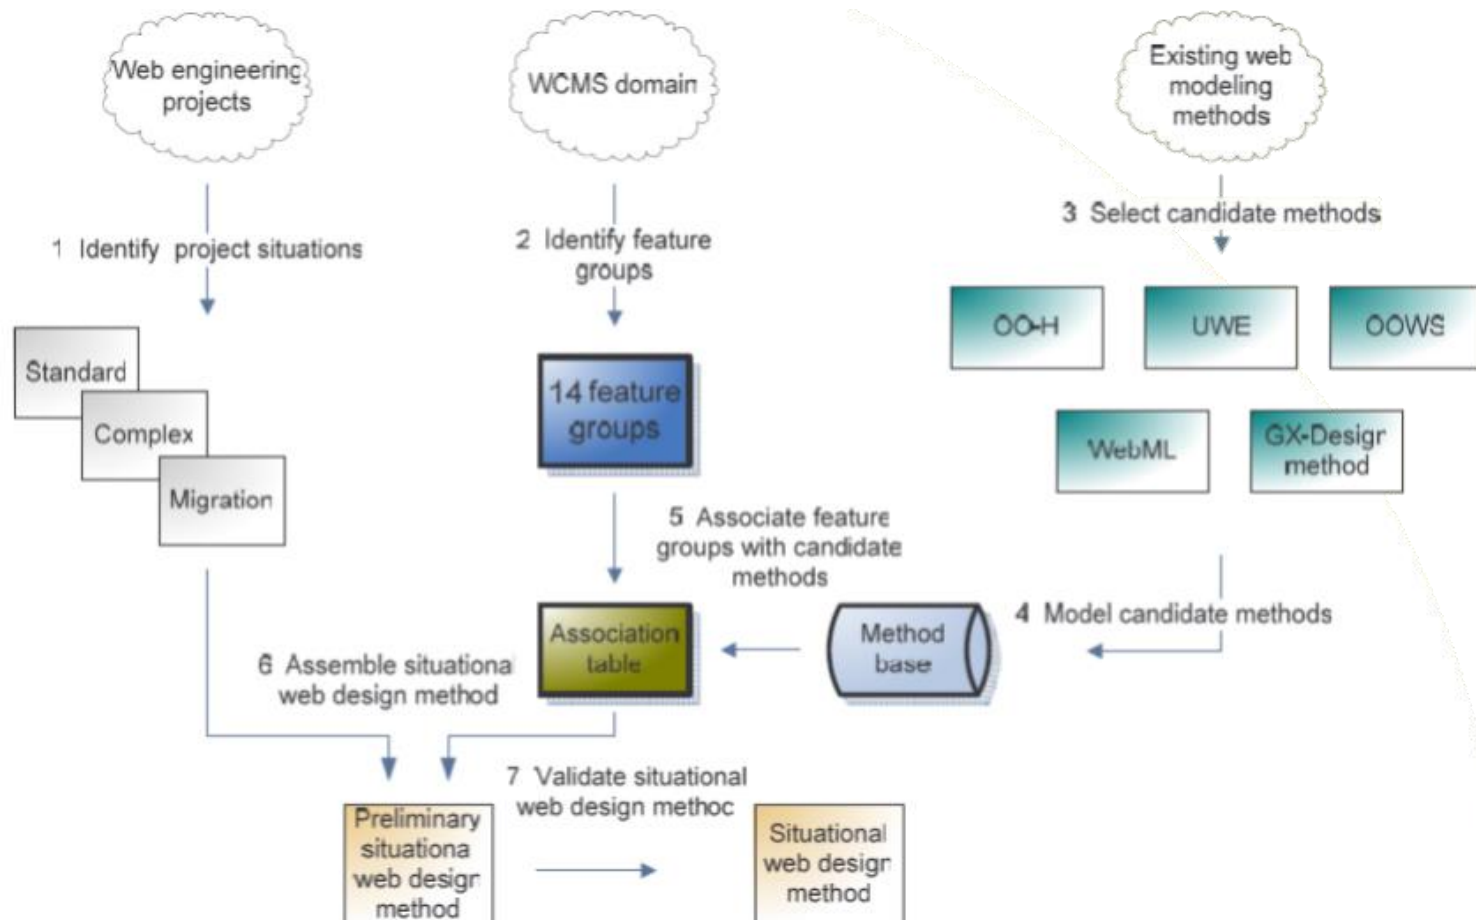

Adopted and extended by Van de Weerd et al. (2006)...

1. Analyze implementation situations and identify needs.
2. Select candidate methods that meet one or more aspects of the identified needs.
3. Analyze candidate methods and store relevant method fragments in a method base.
4. Assemble a new method from useful method fragments and use route map configuration to obtain situational methods

...adopted and extended by Luinenburg (2008)

Outline

- We are standing on the shoulders of giants...
 - Method engineering
 - Creation of methods
 - Tool support
 - Method comparison
- ...but do not always agree with each other

Tool support

- CASE: Computer Aided Software Engineering
- CAME: Computer Aided Method Engineering

A CAME tool can be used for three purposes:

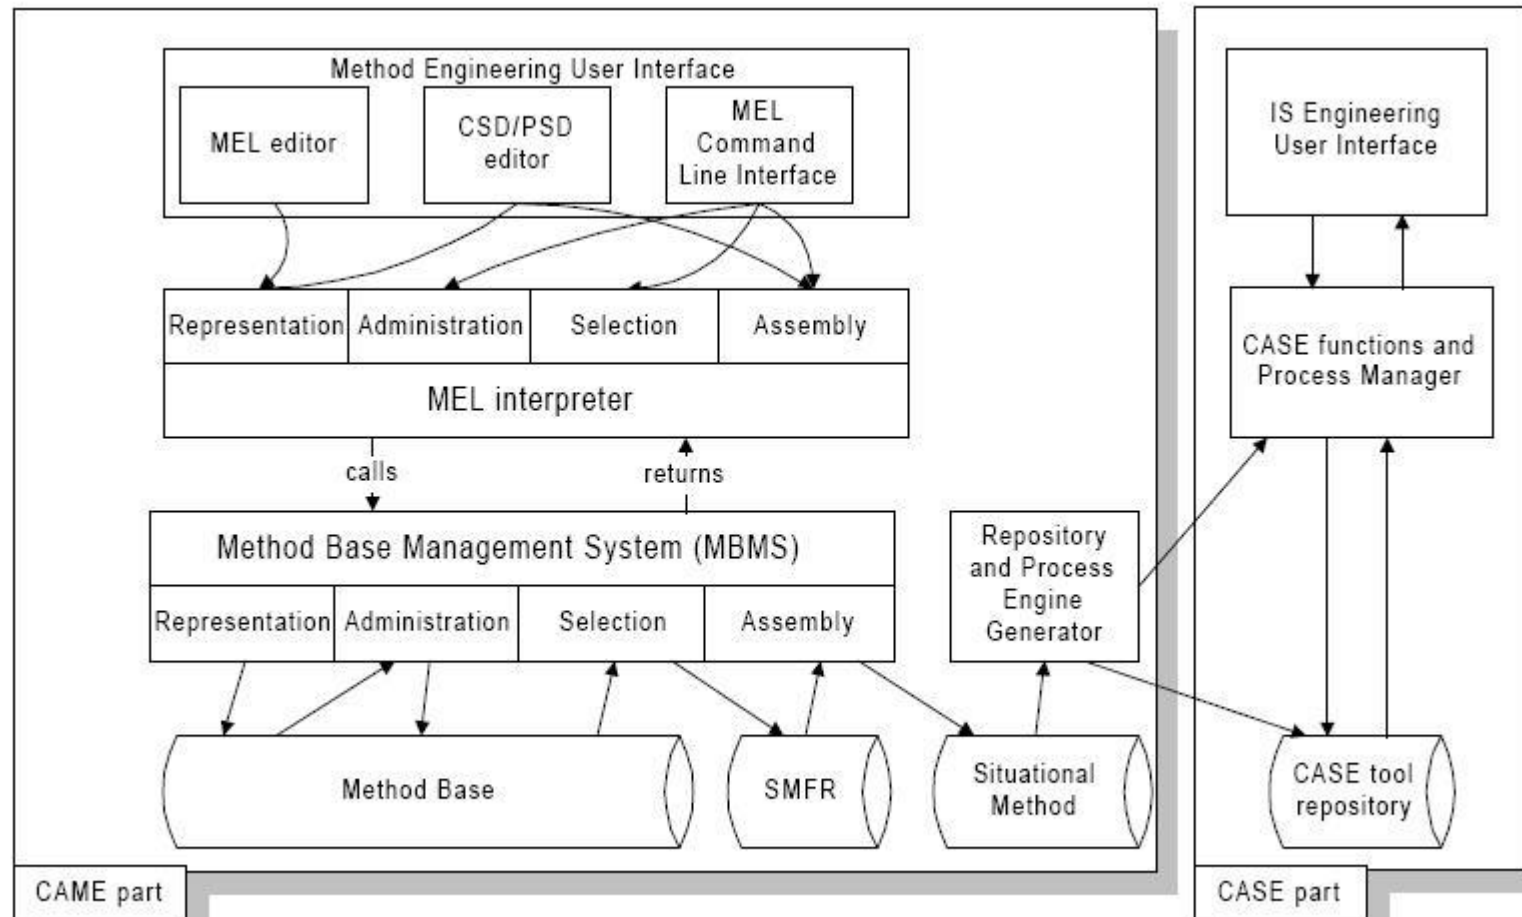

- 1) to specify methods to be used in a method environment,*
- 2) to compare, analyze, and select methods; and*
- 3) to store the accumulated knowledge of methods and situation factors.*

Martiin, Harmsen & Rossi (1996)

Decamerone (Twente)

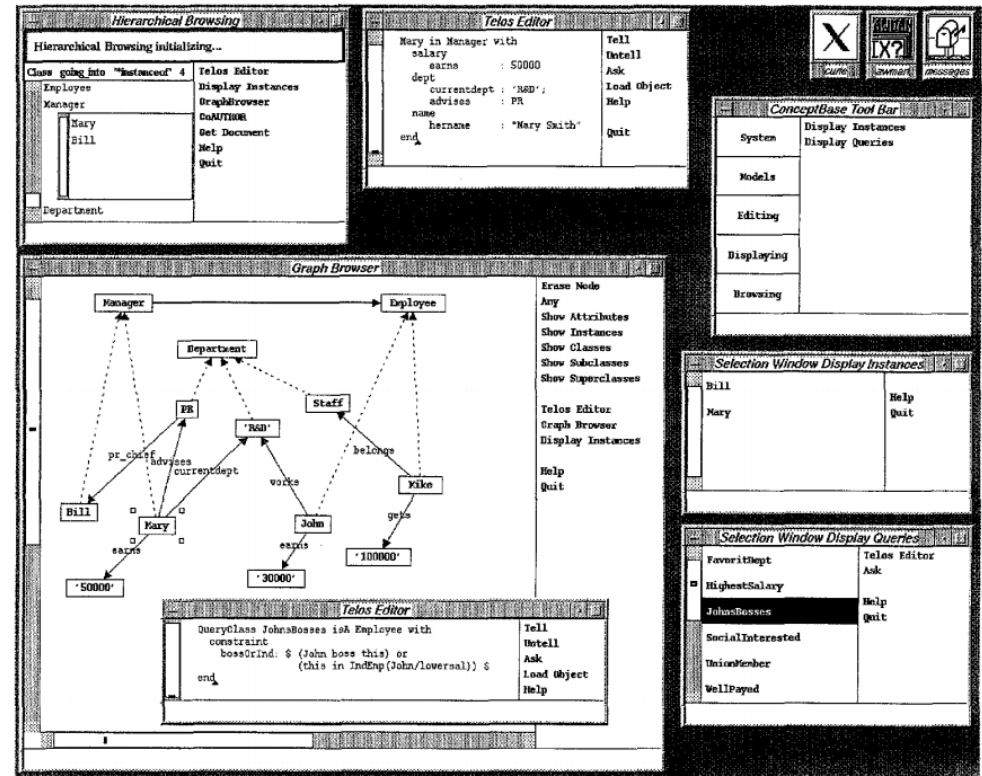

- Harmsen, Situational Method Engineering (dissertation,

ConceptBase (Aachen)

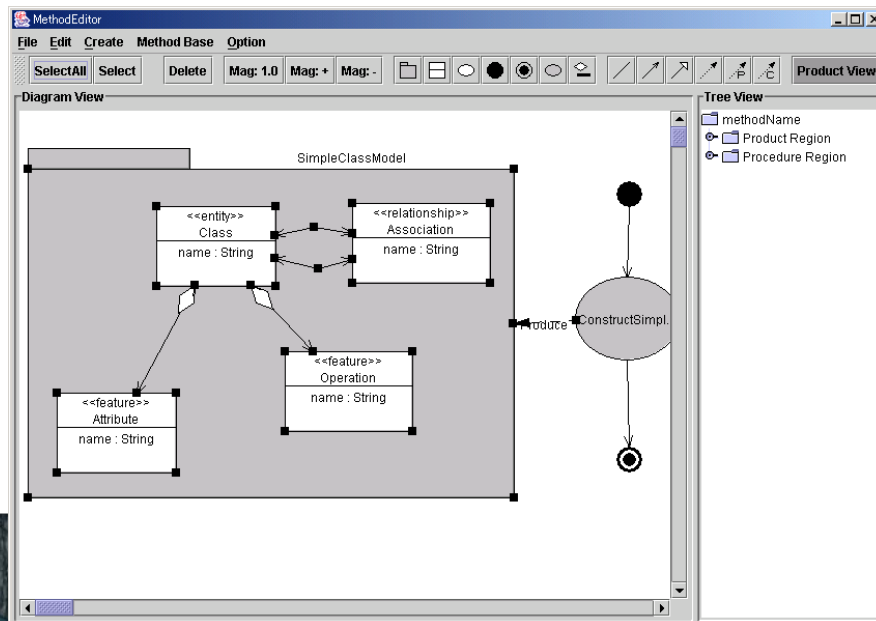

- Database system for meta modeling and method engineering.
- Based on an object-centered data model, that is manipulated by using logic (in the textual interface) or by drawing (in the graphical user interface).
- First-order logic formulas are used to express constraints and queries.

Jeusfeld, Jarke, Nissen & Staudt (1998)

MethodBase (Tokyo)

- Product and process fragments are represented with a simplified version of UML class diagrams and activity diagrams respectively.
(→ predecessor of PDDs)
- In addition, constraints on method fragments can be defined using the Object Constraint Language (OCL).

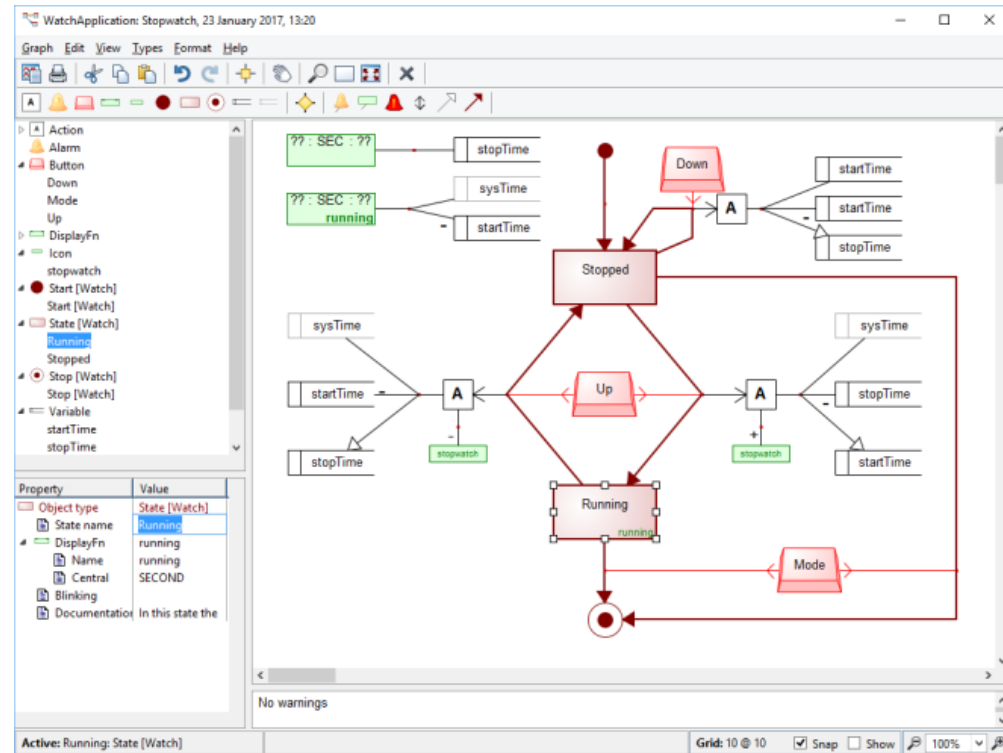

Saeki (2006)

MetaEdit+ (Jyvaskyla, Fi)

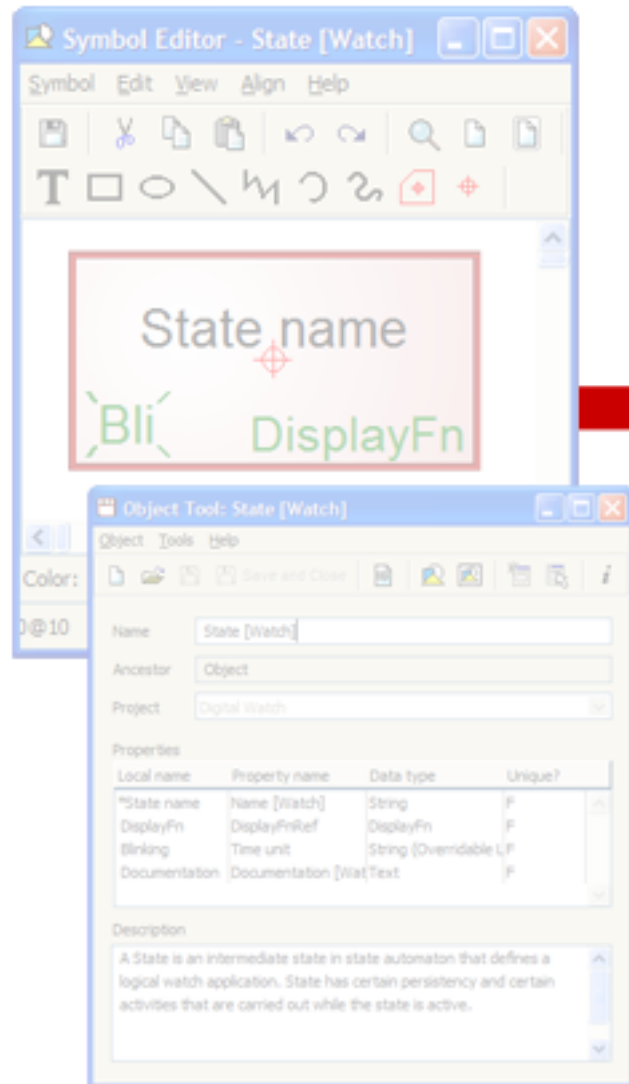

- Commercial tool
 - Workbench to create modeling technique
 - Modeling environment to work with the actual method

*Kelly, Lyytinen & Rossi
(1996)*

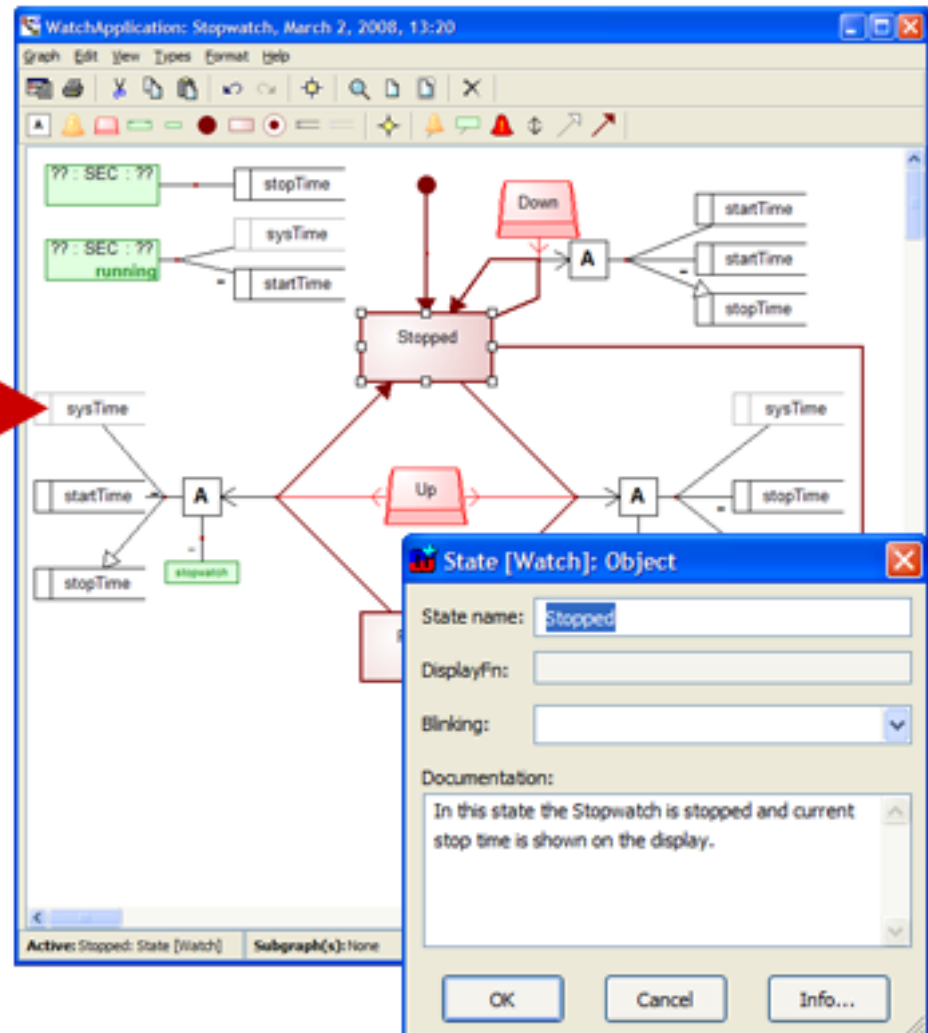

MetaEdit+ (2)

Design your modeling language

Projects
PDD

- REQUIREMENT
 - Closed concept
 - Open concept
- RELEASE DEFINITION
 - Decision
 - [approved]
 - Start
 - Start
 - Stop
 - Stop
 - Closed activity
 - Main activity
 - Sub activity
 - Gather requirements
 - Discuss release definition
 - Prioritize requirements
 - Write release definition

Property	Value
Object type	Sub activity
Activity name	Write release definition
Activity role	Product manager
Description	
Main activity	

```

graph TD
    Start(( )) --> Gather[Gather requirements<br/>Product manager]
    Gather --> Prioritize[Prioritize requirements<br/>Product group]
    Prioritize --> Write[Write release definition<br/>Product manager]
    Write --> Discuss[Discuss release definition with<br/>board/product manager, board]
    Discuss --> Decision{ }
    Decision -- "[approved]" --> End((( )))
    Decision -- "[else]" --> Write
    Gather -.-> Req[REQUIREMENT]
    Prioritize -.-> Req
    Write -.-> Def[RELEASE DEFINITION]
  
```

The diagram shows a flow from 'Gather requirements' to 'Prioritize requirements' to 'Write release definition' to 'Discuss release definition with board/product manager, board'. A decision diamond follows the discussion, with an '[approved]' path leading to an end node and an '[else]' path looping back to 'Write release definition'. Dashed lines connect the activities to their respective metamodel objects: 'Gather requirements' and 'Prioritize requirements' to 'REQUIREMENT', and 'Write release definition' to 'RELEASE DEFINITION'.

Sub activity: Object

Activity name: Write release definition

Activity role: Product manager

Description: The product manager writes the release definition

Main activity:

Outline

- We are standing on the shoulders of giants...
 - Method engineering
 - Creation of methods
 - Tool support
 - Method comparison
- ...but do not always agree with each other

But we do not always agree...

- Method fragments vs. method chunks
 - Method fragment (Brinkkemper, Saeki, Harmsen, Weerd, etc.)
 - Method chunks (Ralyté, Henderson-Sellers, Rolland, Jeusfeld, etc.)
 - Method components / OPF (Henderson-Sellers)
- Model vs. meta-model

Current trends

- MaaS: Method as a service (Rolland et al., 2007)
Using Web service technology to provide self-describing, platform agnostic elements (MaaS), accessible through standard interfaces and that can be assembled together
- Situationality (Bekker et al., 2008, 2009, 2010)
Identifying and using situational factors that influence the method fragment selection process
- Incremental method (Weerd et al., 2007, Vlaanderen et al., 2012)
Creating small changes of a method to support gradual improvement

Current research

- Integration of DevOps with Scrum (Centric)
 - Capability identification in DevOps
 - Maturity benchmark in large scale software production
- Reference method for Digital Strategy (AndersonMacGyver)
 - Formalizing existing approach
 - Providing scientific justifications
- Open projects for master's thesis research
 - Methods and techniques for software architecture and requirements engineering
 - User stories
 - Continuous architecting
 - Artefacts in agile methods
