## Validity evaluation

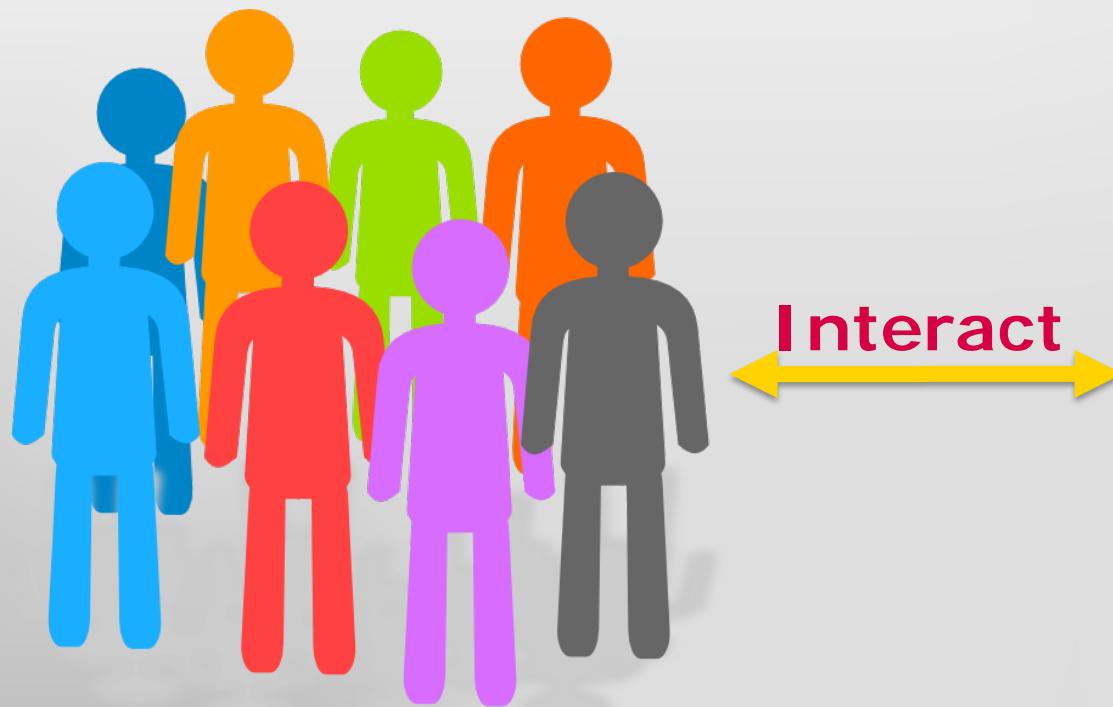

## Validity evaluation

What is the population of your experiment?

The results should be valid just for your population?

Yes

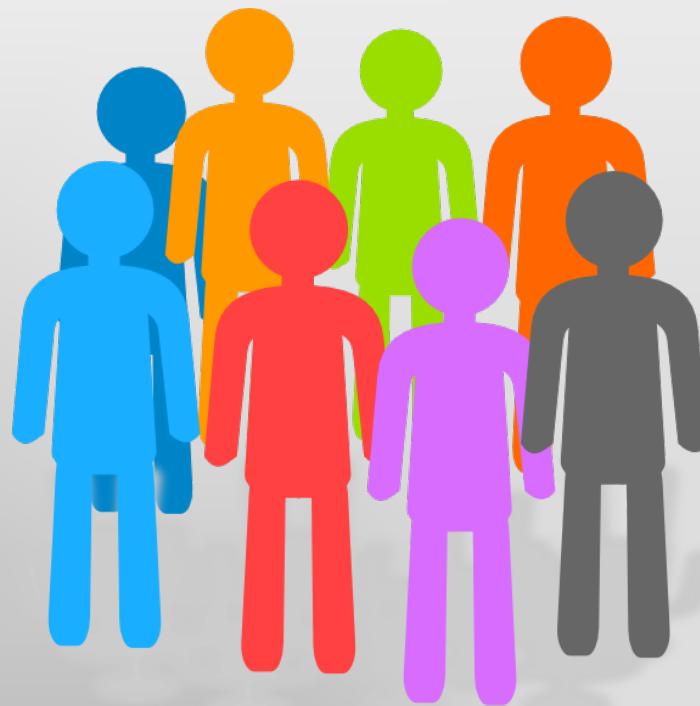

## Validity evaluation

What is the population of your experiment?

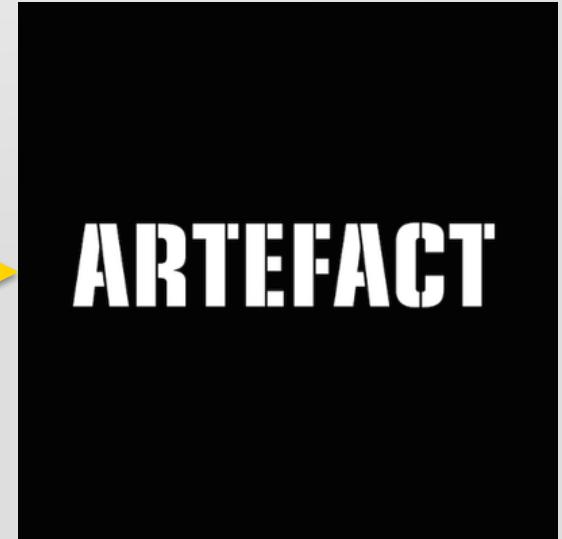

The results should be valid just for your population?

Yes

What happens if I want to generalize the results?

Interact

## Validity evaluation

1. Conclusion validity
2. Internal validity
3. Construct validity
4. External validity

## Conclusion validity

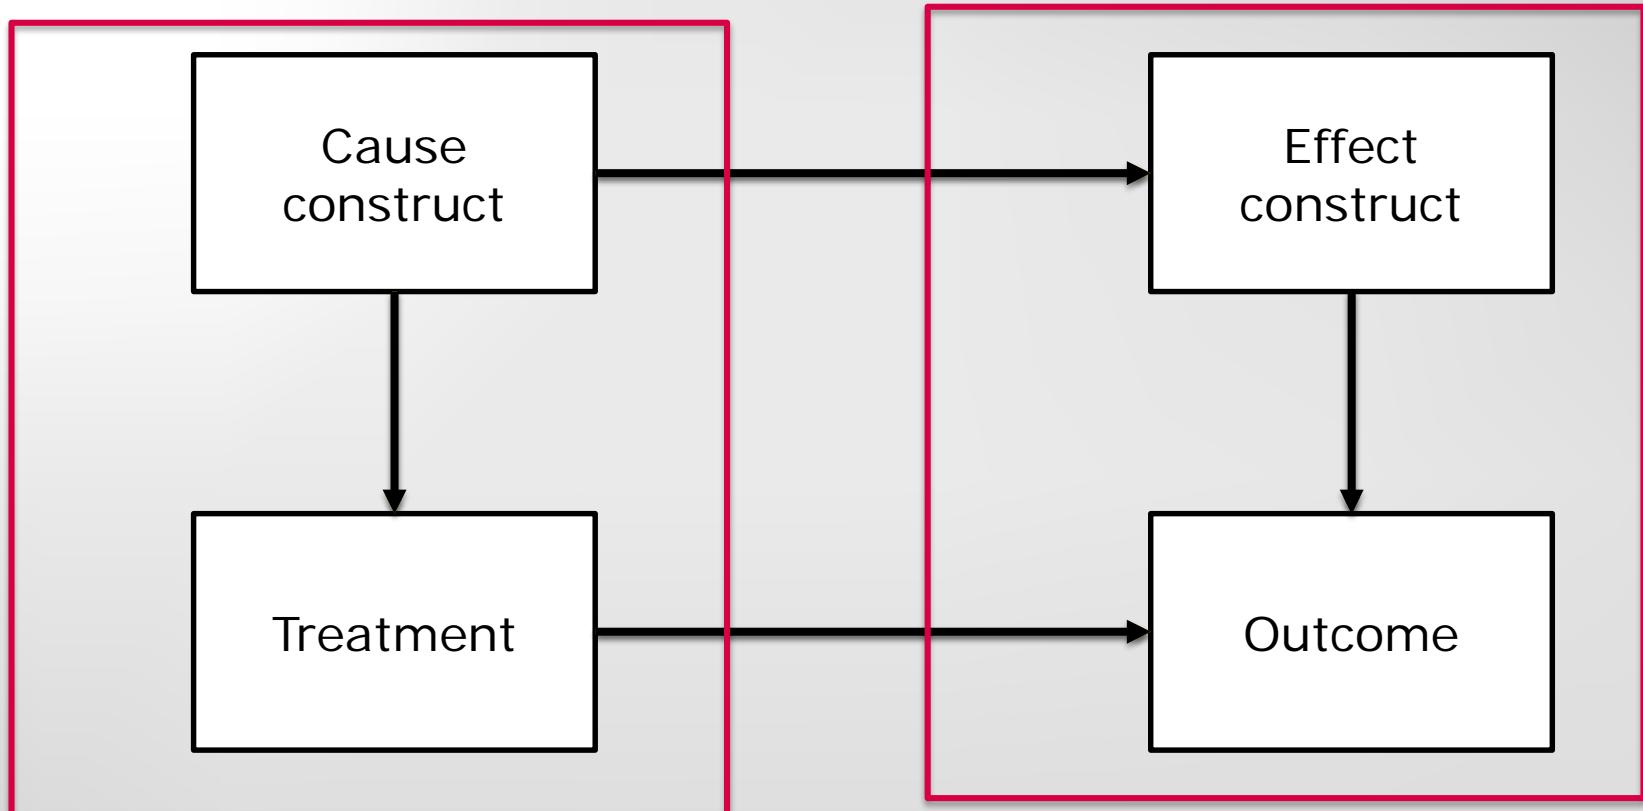

Statistical relationship:  
Significance

## Internal validity

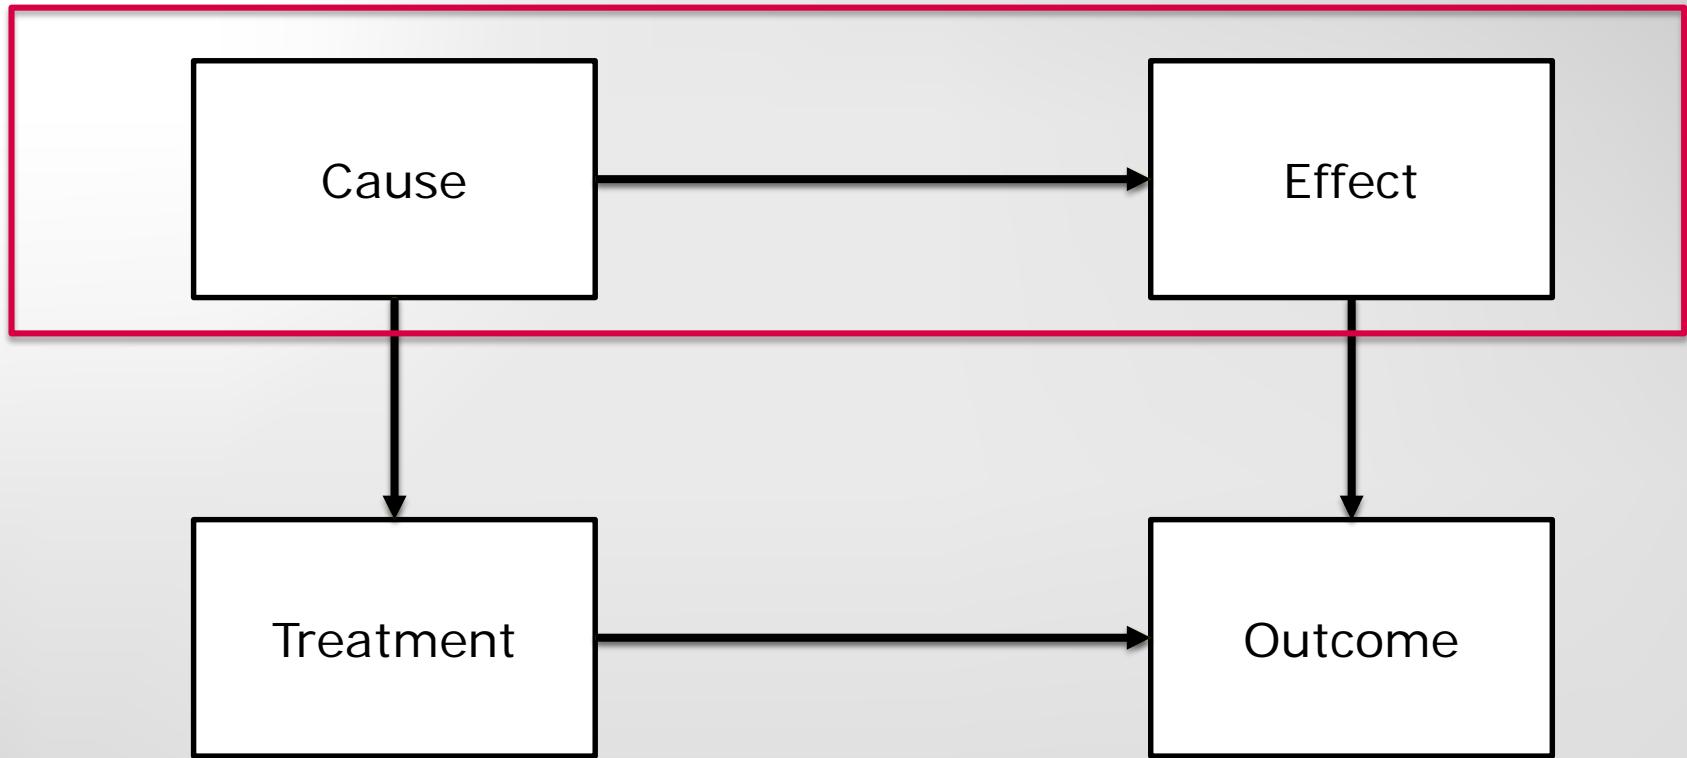

Causal relationship: the treatment causes the outcome

## Construct validity

Causal relationship: experiment setting reflects the construct under study

## External validity

Generalisation: Can the results of the study be generalized outside the scope of study?

## Question

From last year

Hi! I have a question about the measurement of validity. In the email we got it says we have to derive this from output models (created by the research team and the participants). However, shouldn't the validity refer to the treatment? An output model is only valid if the process and guidelines are closely followed. If a participant by accident comes up with a correct output model, we should still regard it invalid, shouldn't we? [@Marcela Ruiz](#) (edited)

What type of threat is mentioned in this question?

## Details about validity threats

Use a checklist for experiment

If there is any threat:

It has to be addressed, or

It has to be accepted!

**There are no silver bullets**

It may be impossible to carry out an experiment without threats

What can we do?

## Validity threats

### Conclusion validity

- Low statistical power
- Violated assumptions of statistical tests
- Fishing and the error rate
- Reliability of measures
- Reliability of treatment implementation
- Random irrelevancies in experimental settings
- Random heterogeneity of subjects

## Discussion

Threats in our experiment

Ideas to mitigate the threats  
/ accept the threats

## Validity threats

### Internal validity

#### Single group threats

- History
- Maturation
- Testing
- Instrumentation
- Statistical regression
- Selection
- Mortality
- Ambiguity about the direction of causal influence

#### Internal validity

##### Multiple group threats

- Interactions with selection

##### Social threats to internal validity

- Diffusion or imitation of treatments
- Compensatory equalization of treatments
- Compensatory rivalry
- Resentful demoralization

## Validity threats

### Internal validity

- Multiple group threats
- Interactions with selection
- Social threats to internal validity
- Diffusion or imitation of treatments
- Compensatory equalization of treatments
- Compensatory rivalry
- Resentful demoralization

## Discussion

Threats in our experiment

Ideas to mitigate the threats  
/ accept the threats

## Validity threats

### Construct validity

- Design of the experiment
- Inadequate explication of constructs
- Mono-operation bias
- Mono-method bias
- Confounding constructs and levels of constructs
- Interaction of different treatments
- Interaction of testing and treatment
- Restricted generalizability across constructs

### Construct validity

- Social
- Hypothesis guessing
- Evaluation apprehension
- Experimenter expectancies

## **Validity threats**

### **Construct validity**

- Social
- Hypothesis guessing
- Evaluation apprehension
- Experimenter expectancies

## Discussion

Threats in our experiment

Ideas to mitigate the threats  
/ accept the threats

## **Validity threats**

### External validity

- Interaction of selection and treatment
- Interaction of setting and treatment
- Interaction of history and treatment

## Discussion

Threats in our experiment

Ideas to mitigate the threats  
/ accept the threats

## Main conclusions

Use a checklist of threats for experimental design

If there is any threat:

- It has to be addressed, or
- It has to be accepted! -> and discussed

## **Validity threats Our experiment**

To do!
